FLUSHING

REJUVENATE THE GROWING MEDIUM

Some forces of nature are not always kind to the soil. Overcome the build-up of sodium, chlorides, and bicarbonates to increase the availability of key beneficial nutrients.

It is also important to remember that a lot of course use retaining wetting agents, which restrict the water movement through the soil profile. Flushing will restore proper air requirements, allowing the rootzone to breath again.

■ REMOVE SODIUM AND CHLORIDES

Calphlex solubilises sodium, chlorides, and bicarbonates, which knocks them off the soil profile, and into a solution.

■ PENETRATE

Pervade is a specially designed product for penetrating the soil profile. It breaks the retaining wetting agents chemistry, and allows the water to move through the soil with increased percolation. Irrigate to field capacity to flush the unwanted nutrients away.

■ OXY-RUSH

Oxy-Rush generates oxygen for beneficial aerobic microbes. They in turn create a far better environment for the turf, allowing for improved nutrient up-take after the flushing process.
