## Move water and keep oxygen in the rootzone

*Proper water and air management is vital to maintain optimum turf grass vitality. Agronomic Services has come up with a way to manage water and balance oxygen levels while optimizing turf grass strength under wet season conditions. Pervade moves excess water through the profile, while Oxy-Rush increases the soil oxygen levels to ensure healthy microbial life.*

*Both products are tank mixable in 600-1000li/ha sprayed onto the soil.*

### ■ **Pervade** (application rate 5li/ha)

Pervade is a specially designed product for penetrating the soil profile. It breaks the retaining wetting agents chemistry, and allows the water to move through the soil with increased percolation.

### ■ **Oxy-Rush** (application rate 10li/ha)

Oxy-Rush generates oxygen for beneficial aerobic microbes. They in turn create a far better soil environment to produce strong healthy disease resistant turf. Late summer and autumn are extremely important times of the year, if the grass goes into winter strong it will look good in spring.

**Three to Four week intervals, £245.00 per application**
