FLOOD RECOVERY

Water logged soils can't breathe! The aerobic microbes do not get sufficient OXYGEN so they are not able to provide enough CO₂ and nutrients for root up-take and plant survival.

Agronomic Services Ltd have developed a way to manage water and balance oxygen levels while optimizing turf grass strength under wet season conditions.

Pervade moves excess water through the profile, while Oxy-Rush increases the soil oxygen levels to ensure healthy microbial life and reduced disease pressure. Both products are tank mixable in 600-1000lts/ha sprayed onto the soil.

PERVADE

(application rate 5lts/ha)

Pervade is a specially designed product for penetrating the soil profile. If there is anywhere for the water to go, Pervade will increase the speed of percolation, allowing the water to move through the soil with increased speed.

OXY- RUSH

(application rate 20lts/ha)

Oxy-Rush generates oxygen for beneficial aerobic microbes. They in turn provide the gas exchange and CO₂ requirement for root up-take. This creates a far better soil environment to produce strong healthy disease resistant turf. Spring, summer and autumn are extremely important times of the year to ensure strong white rooting.
