RETAIN MOISTURE & INCREASE O₂ IN THE ROOTZONE

Correct water and air management is vital to maintain optimum turf grass vitality. Agronomic Services have developed a way to maximize the efficiency of your retaining wetting agent, and increase the amount of dissolved oxygen in the upper rootzone. It is important to remember that retaining wetting agents hold moisture in the rootzone, so it is vital to support the oxygen using microbes with Oxy-Rush.

Both products are tank mixable in 600-1000li/ha and irrigated into the rootzone area. Application rates may vary depending on monthly requirements.

RETAIN PRO

(application rate 20lts/ha)

Retain Pro is a cutting edge wetting agent specifically designed to distribute water and nutrition in the rootzone and interact with soil molecules to reduce leaching and hydrophobia.

OXY-RUSH

(application rate 20lts/ha)

Oxy-Rush generates oxygen for beneficial aerobic microbes. They in turn create a far better soil environment to produce strong healthy disease resistant turf. Spring is a vital time to produce a mass of new roots, remember retaining wetters do not help when it comes to deep rooting.
